Text editor

The file editor for the language automatically formats the saved file to a .twt file extension. This text editor can be used for editing the code, and making it sure it goes through TWT language specifications.

Compiling the code

The TWT programming language has its compiler (converter) named "try".

The TWT code can be run by this command-line input:

```
try <filename>
```

Note that filename doesn't have ".twt" on its argument. The compiler makes sure that it is only processing TWT source codes.

Error codes are seen on the console if there are any problems about the code.

Running the code

After compilation, the program will commence. After program run, it ill automatically close in 10 seconds.
